Scoop box 2, morning																															
Scoop box 2, evening																															
Fresh water																															
Wash bowls																															
Play session(s)																															
Urine clumps today (count)																															

Empty and wash each box

Clumping litter: every 1 to 2 weeks, sooner if it smells or stays damp. Non-clumping: every 2 to 3 days. Hot water, mild soap if you like, no bleach or ammonia.[1]

Box 1

_____ _____ _____ _____

Box 2

_____ _____ _____ _____

Fountain

Go by your fountain's manual. Catit, for example, says a new filter every 30 days for its Flower fountain and a pump clean every 2 weeks.[2]

New filter (every ___ days)

_____ _____ _____ _____

Pump cleaned (every ___ days)

_____ _____ _____ _____

Litter used this month

Bags opened (date and size), then the total. Compare it with the monthly estimate from the measuring tool's litter depth panel.

Bags _____

Total _____

Tool estimate _____

Litter per month
Box size and depth in, liters a month out.

The red row is an early warning. More urine clumps than your cat's usual, or bigger ones, is a reason to call your vet: Cornell names kidney and thyroid disease and diabetes among the causes of urinating more often. Straining with little or no urine is an emergency.[3]

1 AAFP and ISFM 2014; International Cat Care 2025; San Diego Humane Society. 2 Catit, filter and cleaning guides. 3 International Cat Care, lower urinary tract guidelines, 2025 (record urine volume by clump size); Cornell Feline Health Center. Scoop at least once a day, twice if you can.
